The homodimer of this region is thought to be the biologically active form of GDF-8. It is an object of the invention to produce a recombinant therapeutic vaccine capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. Variants of GDF-8 (see AAB20145-53) are provided that are capable of breaking autotolerance against autologous GDF-8. These comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as the promiscuous tetanus toxin T-cell epitope in the possible sites in which the T-cell epitope can be positioned without major disturbance of the native 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Growth differentiation factor-8; GDF-8; huntransforming growth factor-beta; muscle; menuromuscular disease; muscular dystrophy;

invention provides novel mammalian and avian GDP-8 proteins (see CC GDP-8 expression is disrupted or interfered with. Also claimed CC are: (1) Chicken or turkey eggs or meat, beef, milk, pork and lamb CC inhibiting the action of GDP-8 inhibitor; (4) method for increasing muscle mass in CC aridenceding a GDP-8 protein some CC acid encoding a GDP-8 protein truncated by loss of the C-terminal CC and for poultry reduced cholesterol canimals have increased muscle mass in CC and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy CC and aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive lung disease, AIDS CC and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obesity. Also (not claimed) GDP-8 CC anson be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and calso for immunotherapy and in vivo imaging.

The sequence was deduced from a cDNA clone (see AAV45818) isolated from a skeletal muscle cDNA library. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides myostatin peptides consisting of 3-100 amino cids, derived from a region of mouse, rabbit, human, baboon, bovine, concine, ovine, chick, turkey or zebrafish myostatin (see sequences C porcine, ovine, chick, turkey or zebrafish myostatin (see sequences C AAY33930-939). The myostatin peptides are derived preferably from a concept sequences. The peptides and the nucleic acids encoding the peptides C are useful as vaccines for eliciting an immune response in a vertebrate muscle mass, number and size of muscle cells, muscle strength, mammary C gland tissue, lactation, appetite or feed uptake, life span of the vaccines are also useful for treating a disorder consting conditions. The vaccines are also useful for treating a disorder useful for modulating GDFII activity. The present sequence represents a bovine myostatin sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides myostatin peptides consisting of 3-100 amino acids, derived from a region of mouse, rabbit, human, baboon, bovine, chick, turkey or zebrafish myostatin (see sequences C porcine, ovine, chick, turkey or zebrafish myostatin (see sequences C AAY33930-939). The myostatin peptides are derived preferably from a cregion of amino acid residues 1-275, 25-300, 50-325 or 75-350 of the care useful as vaccines for eliciting an immune response in a vertebrate capainst a myostatin immunogen. They result in increasing body weight, conscle mass, number and size of muscle cells, muscle strength, mammary constitute, and cause a reduction in body fat content, useful for muscle wasting conditions. The vaccines are also useful for treating a disorder cuseful for modulating GDF11 activity. The present sequence represents the amino acid sequence of bovine myostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel recombinant cell lines that express growth-differentiation factor-8 (GDF-8) receptor polypeptide or GDF-11 receptor polypeptide. The GDF receptors are used to identify specific (ant) agonists, potentially useful therapeutically in human or veterinary medicine. Antibodies derived from the products of the invention are used to treat muscle tissue diseases (particularly wasting diseases, cord and conducts injury, congenital obstructive pulmonary diseases, acquired immune deficiency syndrome and cachexia). Transgenic, non-human animals that express the products of the invention from a transgene present in germ and somatic cells, specifically where GDF-8 receptor is expressed, increased muscle mass. Peptides derived from the products of the invention and GDF-receptor binding and blocking agents, are reagents and changnostic agents for studying muscle wasting diseases and for development of therapeutic agents. This sequence represents the bovine GDF-8 protein which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of cattle growth differentiation factor (C 8 (GDF-8), also called myostatin. It is an object of the invention (C to produce a recombinant therapeutic vaccine capable of effecting (C down-regulation of GDF-8 in order to increase the muscle growth (C rate of farm animals. Variants of GDF-8 (see AAB20145-53) are (C provided that are capable of breaking autotolerance against (C autologous GDF-8. These comprise a C-terminal portion of human (C GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as the promiscuous tetanus toxin T-cell epitope (C F2 or P30. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity is used to increase muscle mass by up to at least 45% (C in cattle, pigs and poultry used for meat production, reducing the to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic contents for patients suffering from acute and chronic contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a purified promyostatin polypeptide contion. A myostatin peptide is useful as a target for treatment of neurodegenerative diseases such as amyotrophic lateral sclerosis or muscular dystrophy. A myostatin prodomain inhibits myostatin signal transduction, while mature myostatin peptide referred as myostatin is useful for inducing myostatin signal transduction by interacting growth. Modulating myostatin signal transduction is useful for regulation cell. Modulating myostatin signal transduction is a negative regulator or muscle growth. Modulating myostatin signal transduction in a muscle cell or adipose tissue is useful for treating pathological conditions associated with myostatin such as obesity and type II diabetes, cachexia, conditions associated with obesity, e.g. atherosclerosis, hypertension, myocardial infarction, muscle wasting disorders such as muscular dystrophy, neuromuscular disorders, or anorexia. Myostatin prodomain is useful for modulating the growth of muscle or adipose tissue in an organism. Myostatin prodomain is useful for increasing muscle mass or creducing fat content of an organism which is useful as a food source, and morganism e.g. an organism to an environment. Mutant promyostatin or growth differentiation factor (GDF)-11 is useful for reducing or inhibiting myostatin signal transduction. The present or sequence is bovine promyostatin.
                                                                                                                                                                                                                                                                                   Query Match

Also described is a method of modulating an effect of myostatin on a cell by contacting the cell with an agent that affects myostatin signal transduction in the cell. The method and the receptor are useful for ameliorating the severity of a pathological condition characterised by an abnormal amount, development or metabolic activity of muscle or adipose tissue in a subject, particularly a wasting disease) or a metabolic disorder (e.g. cachexia, anorexia, muscular dystrophy or neuromuscular disease) or a metabolic disorder (e.g. obesity or type II diabetes). The promyostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bovine; promyostatin; immunomodulator; antidepressant; anorectic; neuroprotective; antidiabetic; growth differentiation factor receptor; myostatin receptor; GDF; muscle tissue; adipose tissue; cachexia; wasting disorder; anorexia; muscular dystrophy; neuromuscular disease; metabolic disorder; obesity; type II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New growth differentiation factor (GDF) receptors and modulators, useful for ameliorating wasting disorders such as cachexia, muscu dystrophy or neuromuscular disease or a metabolic disorder such a obesity or type II diabetes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bos

                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of bovine myostatin, a member of the transforming growth factor beta superfamily, as encoded by the wild-type gene (see AAX24415). A mutation of this gene (see AAX24416) has been detected in cattle. Cattle of the Belgian Blue breed homozygous for the mutant gene are double-muscled. A new method of increasing muscle mass of a mammal having myostatin-expressing muscle cells, comprises administration of a nucleic acid molecule substantially complementary to at least a portion of mRNA encoding myostatin and of sufficient length to reduce myostatin expression and thus increase muscle mass. A ribozyme may also be used. Also claimed are: a method for determining muscular hyperplasia (MH) in a mammal using primers based upstream and downstream of the mutation; a diagnostic kit for determining the myostatin genotype of a sample of genetic material; a method for determining the myostatin genotype of an animal; a method for determining the myostatin convergence animal; and a transgenic bovine having a gene encoding active myostatin, and a heterologous nucleotide sequence antisense to that gene, and optionally further containing a gene encoding a nucleic acid sequence with ribozyme activity in transcriptional association with the antisense sequence.

                                                                                                                                                                                                                    ided that are capable of breaking autotolerance against us GDF-8. These comprise the C-terminal portion of human which a portion of the native sequence is replaced by a pitope such as the promiscuous tetanus toxin T-cell epitope 0. The high number (9) of Cys residues in the C-terminal imits the possible sites in which the T-cell epitope can be ed without major disturbance of the native 3-dimensional e of the protein. Nucleic acids encoding the GDF-8 variants sed for genetic immunisation of the animals. Down-regulation pigs and poultry used for meat production, reducing the need biotic feed-additives. Anti-GDF8 vaccines can be used to man diseases such as cancer cachexia where muscle atrophy is ed and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ifferentiation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to muteins of a chain of a protein which, when in the form of a homodimer, has antagonistic or partial agonistic activity, and where the mutation results in the protein binding with low affinity to its receptor. The protein is a member of the transforming growth factor beta (TGFbeta) superfamily. The mutant sequences of the invention can be used in the treatment of diseases associated with the overexpression of TGFbeta family proteins, including ectopic bone formation, psoriasis, muscular atrophy, scar formation, fibrosis and cirrhosis. The present sequence is the human GDF8 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New mutein of transforming growth factor-beta superfamily protein, useful for treating or preventing e.g. ectopic bone formation, con for receptor binding -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DE10026713-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of the C-terminal portion of mouse growth differentiation factor-8 (GDF-8), a novel member of the C transforming growth factor-beta superfamily that appears to relate to various cell proliferative disorders, especially those involving muscle, nerve and adipose tissue. The sequence was deduced from a partial genomic clone (see AAV45809). A full-length sequence (see C AAW3089) has been deduced from a cDNA clone (see AAV42113). The cinvention provides novel mammalian and avian GDF-8 proteins (see C AAW3089) has been deduced from a cDNA clone (see AAV42113). The cinvention provides novel mammalian and avian GDF-8 proteins (see C AAW3089) has been deduced from a cDNA clone (see AAV42113). The content of contents of the claimed in which gDF-8 expression is disrupted or interfered with. Also claimed are: (1) chicken or turkey eggs or meat beef, milk, pork and lamb from these animals; (2) method for increasing muscle mass in conimals by administering an antibody (Ab) that binds to GDF-8; (3) inhibitory the action of GDF-8 by treating foetal or adult muscle or progenitor cells with a GDF-8 inhibitor; (4) isolated nucleic active fragment. The transgenic animals have increased muscle mass and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obstructive lung disease, AIDS and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obstructive lung disease, AIDS and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obstructive lung disease, AIDS and cachexia to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and connective tissue and solutions of the connection of the connecti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Gene therapy; growth differentiation factor-8; GDF-8; AIDS; cachexia; neurodegenerative disease; amyotrophic lateral sclerosis; obesity; muscular dystrophy; musculodegenerative disease; tissue repair;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GDF-8 are of commercial interest.

GDF-8 expression may also have a role in the therapy of abnormal growth of muscle, bone or adipose tissue. A GDF-8 monoclonal antibody, GDF-8 antisense molecule or dominant negative polypeptide could be used with foetal or adult muscle cells, bone cells or progenitor cells. These agents can be administered to a patient suffering from a disorder such as muscle wasting disease, neuro muscular disorder, muscle atrophy, osteoporosis, bone degenerative diseases, obesity or other adipocyte cell disorders, and aging for example.
                                                                                     Murine GDF-8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of the C-terminal region of the GDF-8 precursor protein. The predicted GDF-8 sequence contains two potential proteolytic processing sites.

Cleavage of the precursor at the second of these sites would generate a mature C terminal fragment 109 amino acids in length with a predicted molecular weight of 12,400.

                                                                                                                                                                                                                                                     The present invention relates to growth differentiation factor-8 (GDF-8) coding sequences and proteins. The present sequence is a GDF-8 protein, which was isolated in the present invention. GDF-8 is useful for treating neurodegenerative diseases (e.g. amyotrophic lateral sclerosis and muscular dystrophy), musculodegenerative diseases or in tissue repair due to trauma, obesity and disorders related to abnormal proliferation of adipocytes. GDF-8 is also useful for treating malignancies of the various organ systems, particularly cells in muscle or adipose tissues and in gene therapy for the treatment of cell proliferative or immunological diseases mediated by GDF-8. In addition, GDF-8 is also useful for treating muscle wasting disease, neuromuscular disorder, spinal cord injury, traumatic injury, congestive obstructive pulmonary disease (COPD), AIDS or cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New substantially purified growth differentiation factor-8 polypeptide, useful for treating muscle wasting disease, obesity, muscular dystrophy, neuromuscular disorder, acquired immunodeficiency syndrome and cachexia -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lee
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            muscle wasting disease; neuromuscular disorder; spinal cord injury; traumatic injury; congestive obstructive pulmonary disease.
